

~~~~~

Graph Revision (Theory + Problems)

~~~~~

Agenda of the session :

1. FAQs about the session.
2. Introduction and Type of Graphs
3. Traversal Algorithms
 - a. BFS
 - b. DFS
4. Rotten Oranges * Connected Comps.
5. Topological Sort → Kahn's Algo
6. Dijkstra's Algorithm
7. Cycle in graphs
 - a. For directed graph
 - b. For undirected graph

FAQs about the session

- About me?

Name: Shreesh Tripathi

Work: SE and Instructor in SCALER

Teaching Experience: teaching DSA for 3.5 years

In Scaler: More than 350+ sessions

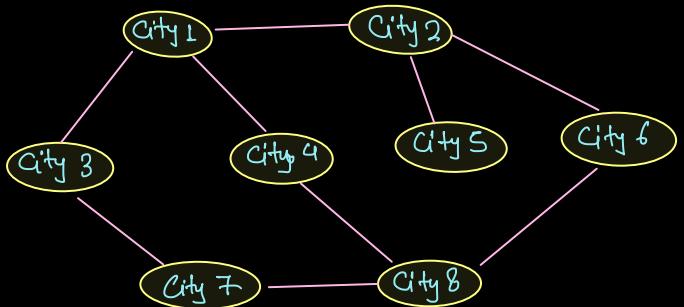

- Is this session worth it if I didn't attend Graph's session? → Revision
Not useful .
 - About the Pace of this session? → Pace fast
 - How We Proceed in this session, How we revise the content of 3 sessions in 1.
 - * Pre-written Notes.
 - * Pre-written code [JAVA]
 - * Proceed with fast pace.
 - Can We Discuss Problems from any other topic?
 - * Not any other topic .
- * Revision session , not problem solving session .

Introduction and Type of Graphs

Vertex : 8 [City 1, 2, 3, ... 8]

Edge : 9

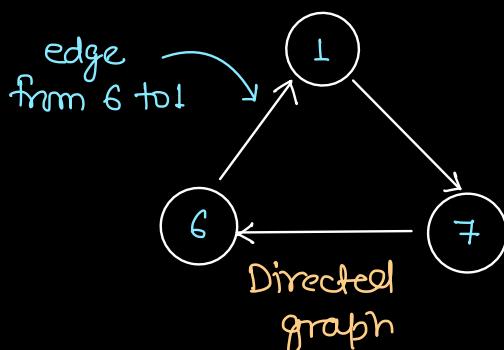

[1-2, 1-3, 1-4, 2-5, 2-6, 3-7, 7-8, 4-8, 6-8]

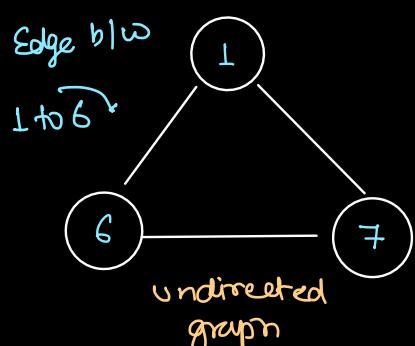

Graph: Collection of vertices and edges is graph.

Type of Graph

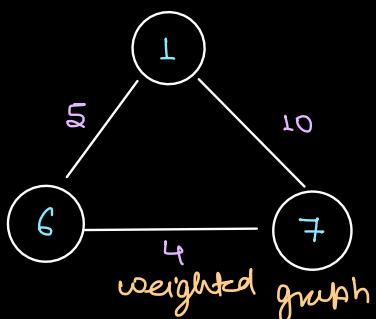

✓ Undirected Graph

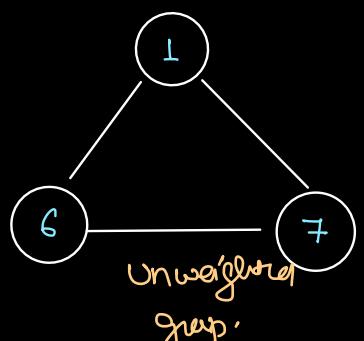

✓ Directed Graph

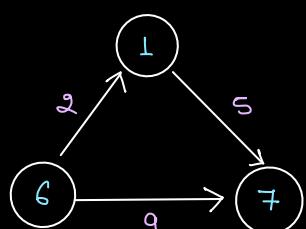

✓ Weighted Graph

✓ Unweighted Graph

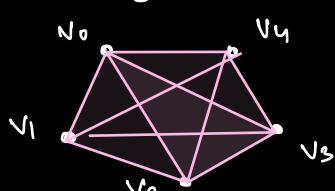

✓ A combination of the above is also
Also possible

→ directed weighted graph
→ Other combination is also possible.

✓ Complete Graph

Count of Edge in a complete graph:

→ Vertex is connected with each other.

$$\text{count of edge in complete graph} = {}^n C_2 = \frac{n(n-1)}{2}$$

How to Implement Graph Data Structure?

- Adjacency Matrix
- Adjacency List

vertex = 7, edges = 8

| | 0 | 1 | 2 | 3 | 4 | 5 | 6 |
|---|---|---|---|---|---|---|---|
| 0 | 0 | 1 | 0 | 1 | 0 | 0 | 0 |
| 1 | 1 | 0 | 1 | 0 | 0 | 0 | 0 |
| 2 | 0 | 1 | 0 | 1 | 0 | 0 | 0 |
| 3 | 1 | 0 | 1 | 0 | 1 | 0 | 0 |
| 4 | 0 | 0 | 0 | 1 | 0 | 1 | 1 |
| 5 | 0 | 0 | 0 | 0 | 1 | 0 | 1 |
| 6 | 0 | 0 | 0 | 0 | 1 | 1 | 0 |

Drawback:

→ Waste of memory.

→ n^2

Edge →

## Traversal Algorithms

~~~~~

I. DFS (Depth-First Search) → Recursive Approach , move in Depth first

II. BFS(Breadth-First Search) → Iterative Approach , Explore graph by radical movement.

~~~~~

### DFS: Depth-First Search

~~~~~

Steps of Depth First Search :

1. Start at the Selected Node

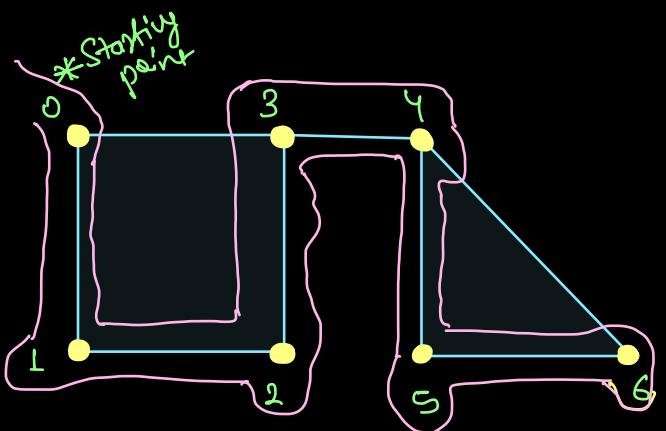

Before starting, mark that node in the visited array

2. Start Recursive traversal

3. Iterate on all neighbors

4. If not visited, mark it and move toward it

5. Repeat Until All Nodes Are Visited

```

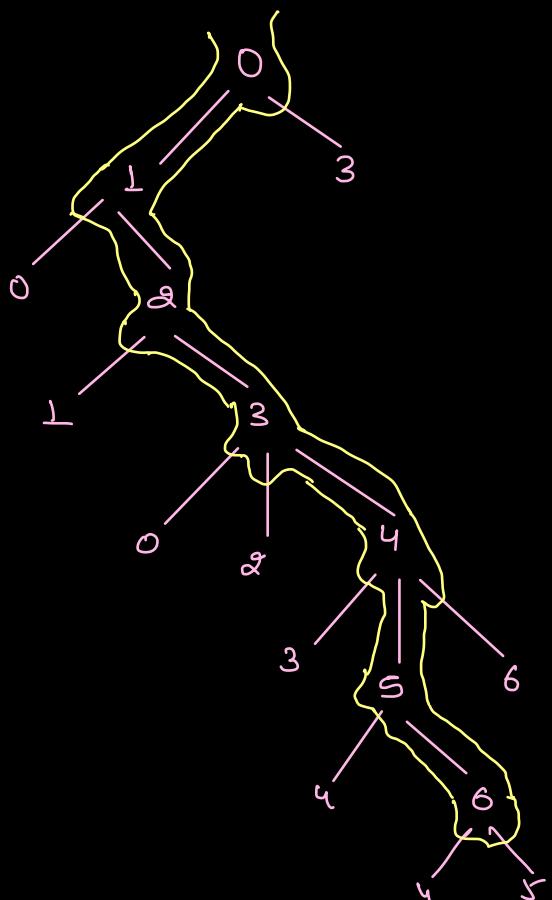

public static void DFS(ArrayList<ArrayList<Integer>> graph) {
    // total vertex
    int n = graph.size();
    // prepare visited array
    boolean[] vis = new boolean[n];
    // For Now, assume source point
    int src = 0;
    // mark yourself and then make call to helper of DFS function
    vis[src] = true;
    dfsHelper(graph, src, vis);
}

public static void dfsHelper(ArrayList<ArrayList<Integer>> graph,
    int src, boolean[] vis) {
    // 1. Print
    System.out.print(src + " ");
    // 2. move toward unvisited neighbour
    for(int nbr : graph.get(src)) {
        // unvisited neighbour
        if(vis[nbr] == false) {
            // mark that neighbour
            vis[nbr] = true;
            // move toward that neighbour
            dfsHelper(graph, nbr, vis);
        }
    }
}

```

path → tracker

| | | | | | | | |
|---|---|---|---|---|---|---|---|
| τ | τ | τ | τ | τ | τ | τ | τ |
| 0 | 1 | 2 | 3 | 4 | 5 | 5 | 6 |

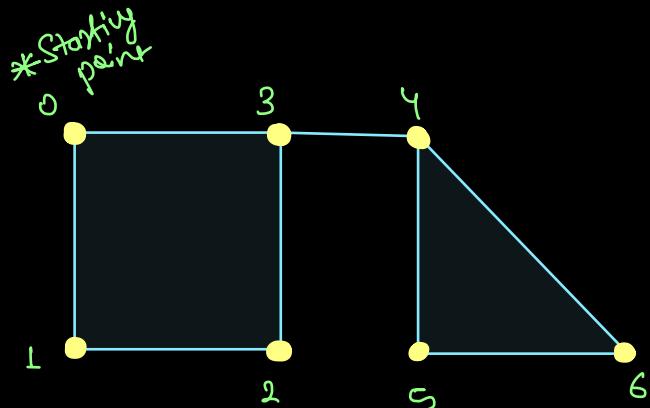

~~~~~

## BFS: Breadth-First Search

~~~~~

Steps in the BFS Algorithm:

1. Make a Queue and add a source point to it
2. Make a visited array and mark the source point in it
3. Process the Queue until it is empty
 - a. Remove
 - b. Work → print
 - c. Add unvisited neighbor
While adding it → mark the nbr

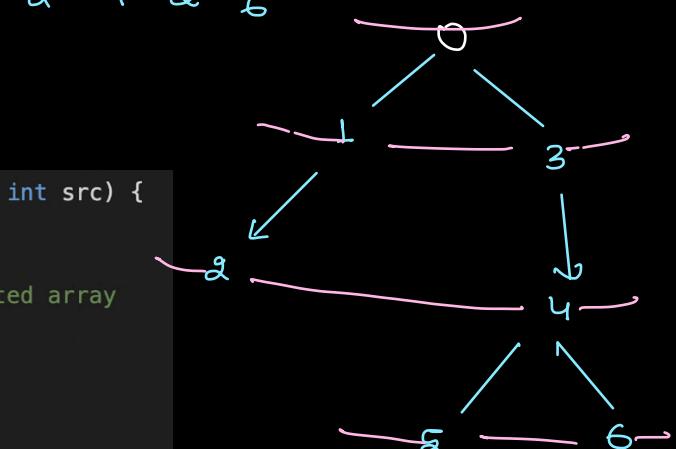

| | | | | | | |
|---|---|---|---|---|---|---|
| T | T | T | T | T | T | T |
| 0 | 1 | 2 | 3 | 4 | 5 | 6 |

O/P: 0 1 2 3 4 5 6

Code (in JAVA)

```
public static void BFS(ArrayList<ArrayList<Integer>> graph, int src) {
    // number of vertex
    int n = graph.size();
    // creation of boolean array for representation of visited array
    boolean[] vis = new boolean[n];
    // Queue for BFS
    Queue<Integer> qu = new ArrayDeque<>();
    // Add source point in queue and mark it in visited
    qu.add(src);
    vis[src] = true;
    // que traversal
    while(qu.size() > 0) {
        // remove
        int rem = qu.remove();
        // print
        System.out.print(rem + " ");
        // add unvisited neighbours
        for(int nbr : graph.get(rem)) {
            if(vis[nbr] == false) {
                vis[nbr] = true;
                qu.add(nbr);
            }
        }
    }
}
```

Application of BFS

→ shortest path in terms of edge

→ Rotten Oranges

→ Connected Component

→ No of island - 1

→ No of island 2

→ Alice and bandidy

~~~~~

## Rotten Oranges

~~~~~

You are given an $m \times n$ grid where each cell can have one of three values:

0 → representing an empty cell,

1 → representing a fresh orange, or

2 → representing a rotten orange.

Every minute, any fresh orange that is 4-directionally adjacent to a rotten orange becomes rotten.

Return the minimum number of minutes that must elapse until no cell has a fresh orange.

If this is impossible, return -1.

Approach: Multi Source BFS

| 0 | 1 | 2 | 3 | 4 | |
|---|------------|------------|------------|------------|------------|
| 0 | T=2 1 ↗ | T=2 1 ↘ | 0 | 1 ↗ T=1 | 0 |
| 1 | 0 | 1 ↗ T=1 | T=1 1 ↙ | 2 ↗ T=0 | 1 ↘ T=1 |
| 2 | T=1 1 ↙ | 2 ↗ T=0 | 1 ↘ T=1 | 0 | 1 ↘ T=2 |
| 3 | 0 | 0 | T=2 1 ↘ | 0 | 0 |

Radially a rotten orange is rotten
fresh oranges.

$T=0 \rightarrow (1,3), (2,1)$

$T=1 \rightarrow (0,3), (1,2) \{ (1,4), (1,0), (2,0), (2,2) \}$

$T=2 \rightarrow (2,4) \{ (0,1), (3,2) \}$

$T=3 \rightarrow (0,0)$

$\underline{\underline{\text{ans: 3 minutes}}}$

$T=4 \rightarrow X$

| 0 | 1 | 2 | 3 |
|---|------------|------------|------------|
| 0 | 1 | 0 | 0 |
| 1 | 0 | 2 ↗ T=1 | 2 ↘ T=1 |
| 2 | 2 ↗ T=2 | 2 ↘ T=2 | 0 |

Remove
work
add unvisited nbr
 \rightarrow move

class {

```
int x;  
int y;  
int t;
```

3

Starting point
~~(1,3,0), (2,1,0) | (0,3,1), (1,2,1) | (1,1,1) | (2,0,1)~~
~~(2,2,1)~~

$T=0$ {
 $1,3 \rightarrow 0$
 $2,1 \rightarrow 0$ } {
 $0,3 \rightarrow 1$
 $1,2 \rightarrow 1$
 $1,1 \rightarrow 1$
 $2,0 \rightarrow 1$
 $2,2 \rightarrow 1$ }

All oranges are not
rotten → $\boxed{-1}$ \geq

Queue<Pair> que = new ArrayDeque<>();

Code :

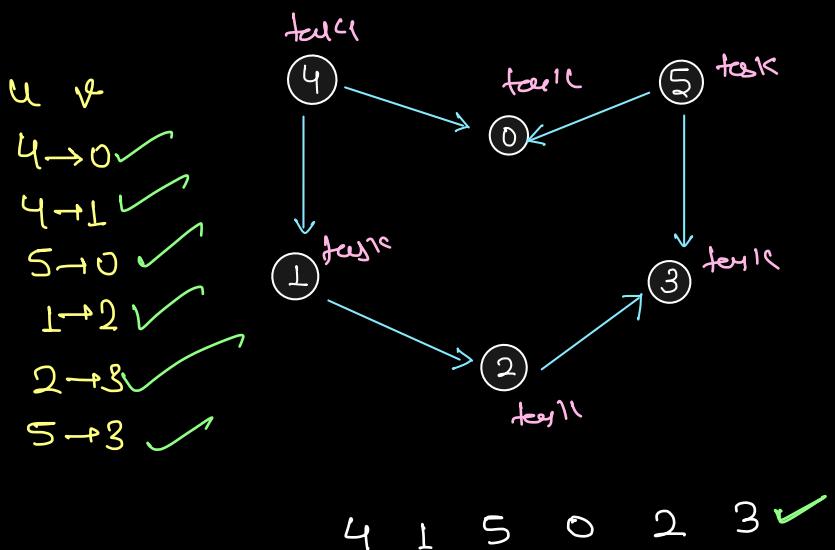

```
5  public static class Pair {
6      int i;
7      int j;
8      int t;
9      public Pair(int i, int j, int t) {
10         this.i = i;
11         this.j = j;
12         this.t = t;
13     }
14 }
15
16 public static int[] xdir = {-1, 0, 1, 0};
17 public static int[] ydir = {0, -1, 0, 1};
18
19 public static int rottenOranges(int[][] arr) {
20     /*
21         Make a queue and add all oranges which are already rotted
22         if they are already rotted, time for them is T=0
23         make sure while adding rotted oranges in queue
24         take the count of total oranges as well
25     */
26     int n = arr.length; ] Row and column Count
27     int m = arr[0].length; ] Row and column Count
28
29     Queue<Pair> qu = new ArrayDeque<>(); ] Apply BFS Algo
30
31     int count = 0; ] To calculate total orange
32     for(int i = 0; i < n; i++) {
33         for(int j = 0; j < m; j++) {
34             if(arr[i][j] == 2) {
35                 // (i,j) location is already rotted
36                 qu.add(new Pair(i,j,0)); ] If Rotted add with t=0
37             }
38
39             // count the total orange as well
40             // arr[i][j] == 1 || arr[i][j] == 2 => arr[i][j] != 0
41             if(arr[i][j] != 0) {
42                 // rotted + fresh ] If it is orange add it in count
43                 count++;
44             }
45         }
46     }
47
48     // Apply BFS Algorithm on que
49     // multiple starting point available for BFS
50     int time = 0;
51     while(qu.size() > 0) {
52         // remove
53         Pair rem = qu.remove();
54         // one orange rotted, decrease the count from total orange
55         count--;
56         // work -> maximise the time
57         time = rem.t;
58
59         // add unvisited neighbour
60         // iteration on 4 direction -> top, left, down, right
61         for(int d = 0; d < 4; d++) {
62             int r = rem.i + xdir[d];
63             int c = rem.j + ydir[d];
64             helping in making sure that location is valid
65             if(r >= 0 && r < n && c >= 0 && c < m && arr[r][c] == 1) {
66                 // marking
67                 arr[r][c] = 2;
68                 // adding in que
69                 qu.add(new Pair(r,c, rem.t + 1)); ] helping in making
70             } ] sure that added
71         } ] orange is fresh.
72         if(count == 0) {
73             return time;
74         } else {
75             return -1;
76         }
77     }
}
```

~~~~~

## Topological Sort

~~~~~

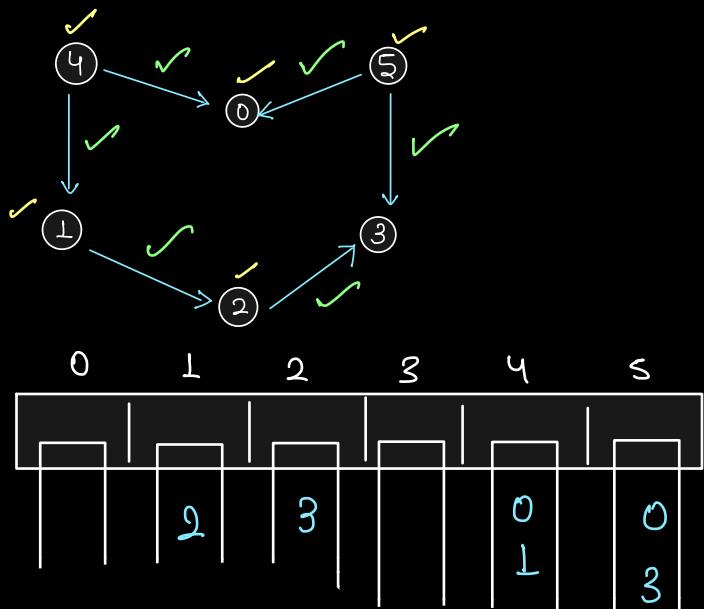

Linear Order of the graph such that for every directed edge $u \rightarrow v$, vertex u comes before v in order. It is Applicable for (Directed Acyclic Graph -> DAG)

NOTE: for single Graph, more than 1 topological order is possible.

| | | | | | | |
|---|---|---|---|---|---|---|
| 3 | 1 | 0 | 2 | 5 | 4 | X |
| 4 | 0 | 5 | 3 | 1 | 2 | X |
| 4 | 5 | 0 | 2 | 1 | 3 | X |
| 4 | 5 | 0 | 1 | 2 | 3 | ✓ |
| 5 | 4 | 0 | 1 | 2 | 3 | ✓ |

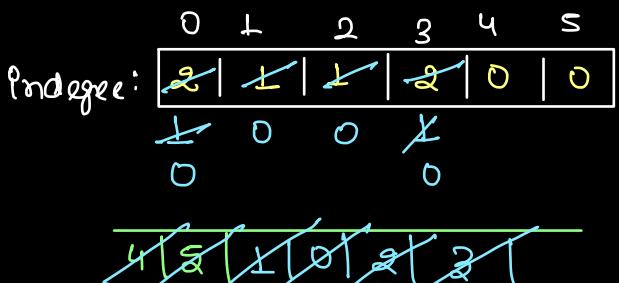

Kahn's Algorithm

- Remove front element of que
- print removed element → topological order
- Decrease indegree of nbr of removed elem while decreasing, if indegree becomes 0 add it in queue.

Kahn's Algo:

- ① Create arr indegree arr.
- ② Add vertex with 0 indegree in que.
- ③ traverse and solve que.

O/p: 4 5 1 0 2 3
 \Rightarrow Topological Sort

```

// topological Sort -> Kahn's Algorithm
public static void topologicalSort(ArrayList<ArrayList<Integer>> graph) {
    int n = graph.size();
    // 1. prepare indegree array
    int[] indegree = new int[n];
    for(int v = 0; v < n; v++) {
        // and edge available from v->nbr
        // indegree of nbr increased by 1
        for(int nbr : graph.get(v)) {
            indegree[nbr]++;
        }
    }

    // 2. add 0 indegree vertex in queue and process it
    Queue<Integer> qu = new ArrayDeque<>();
    for(int v = 0; v < n; v++) {
        if(indegree[v] == 0) {
            qu.add(v);
        }
    }

    // 3. Queue Processing
    while(qu.size() > 0) {
        // 3.1 Remove front element from queue
        int rem = qu.remove();
        // 3.2 Print Removed vertex (topological order)
        System.out.print(rem + " ");
        // 3.3 Iterate on nbr of removed vertex and decrease
        // indegree of nbr, if indegree becomes 0, add it in que
        for(int nbr : graph.get(rem)) {
            indegree[nbr]--;
            if(indegree[nbr] == 0) {
                qu.add(nbr);
            }
        }
    }
}

```

(4)

n=6

order of execution:
reverse of topological
sort

~~~~~

## Dijkstra's Algorithm

~~~~~

Single Source shortest path in terms of weight.

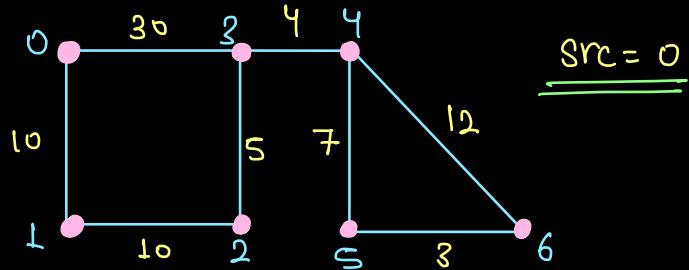

Using BFS \leftarrow Shortest path from 0-3 (edge)

$0-3 \rightarrow \text{weight} = 30$

Dijkstra's \leftarrow Shortest path from 0-3 (weight)

$0-1-2-3 \rightarrow \text{weight} = 25$

Example:

Shortest path from '0'

| | | | | | | |
|---|----|----|----|----|----|----|
| 0 | 10 | 20 | 25 | 29 | 36 | 39 |
| 0 | 1 | 2 | 3 | 4 | 5 | 6 |

~~~~~

Steps of Dijkstra's Algorithm:

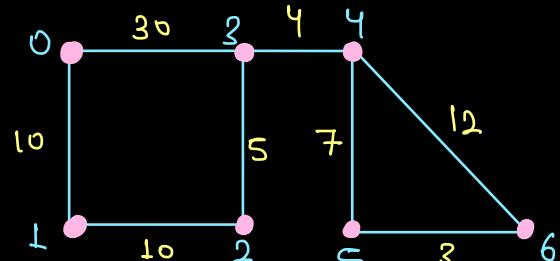

~~~~~

- Make a Priority Queue
- Add Pair(have vtx, wsf) of Source Point in it
- Make a visited array
- Process the Priority Queue until it is empty

wsf \Rightarrow weight so far

mark
Diff b/w
BFS
Dijksho

- Remove the pair
- If the pair is already marked \rightarrow continue
- Otherwise, mark it
- Iterate on all nbrs of removed vtx,
If not visited, make a pair and add them in PQ

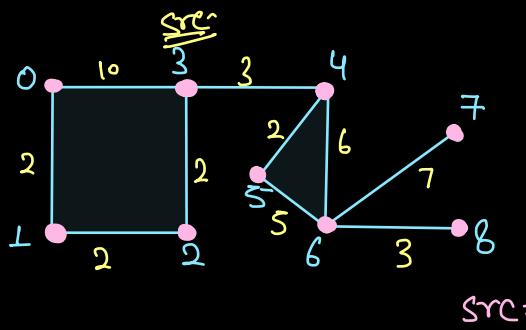

Source = 0

* Rem
* work
* Add unvisited
nbr

| | | | | | | |
|---|----|----|----|----|----|----|
| T | T | T | T | T | T | T |
| 0 | 10 | 20 | 25 | 29 | 36 | 39 |

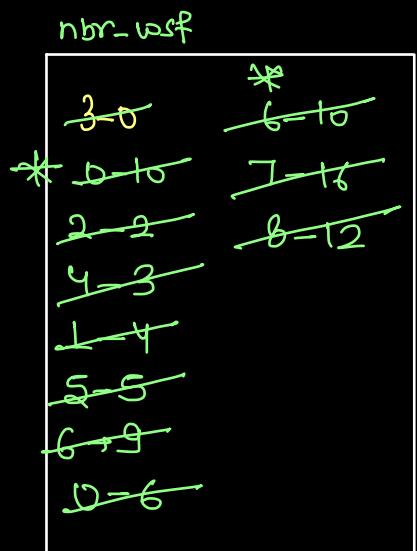

| | |
|--------|--------------------------|
| 0 - 0 | Shortest path |
| 1 - 10 | |
| 2 - 20 | * Already marked |
| 3 - 30 | * Already marked |
| 4 - 25 | → Already visited |
| 5 - 29 | + newly better wsf |
| 6 - 36 | |
| 6 - 39 | |
| 6 - 44 | * Already marked + extra |

Priority Queue \rightarrow

vis: T T T T T T T T T T
 Array:

| | | | | | | | | |
|---|---|---|---|---|---|---|----|----|
| 6 | 4 | 2 | 0 | 3 | 5 | 9 | 16 | 12 |
| 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |

```
class Pair {
    int vtx;
    int wsf;
    String psf;
}
```

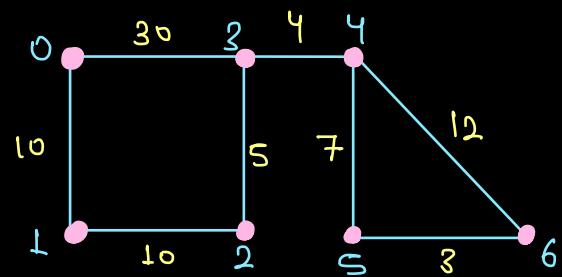

NOTE: Single source multiple destination min PQ
 shortest path Algo \Rightarrow Dijkstra's Algo.

```
// Dijkstras Algorithm
public static class DPair {
    int vtx;
    int wsf;
    String psf;

    public DPair(int vtx, int wsf, String psf) {
        this.vtx = vtx;
        this.wsf = wsf;
        this.psf = psf;
    }
}

public static void dijkstrasAlgo(ArrayList<ArrayList<Pair>> graph, int src) {
    int n = graph.size();
    // 1. Priority Queue
    PriorityQueue<DPair> pq = new PriorityQueue<>(new Comparator<DPair>() {
        public int compare(DPair a, DPair b) {
            return a.wsf - b.wsf;
        }
    });
    pq.add(new DPair(src, 0, src + ""));
    boolean[] vis = new boolean[n];
    // 2. Process PQ
    while(pq.size() > 0) {
        // 2.1 remove
        DPair rem = pq.remove();
        // 2.2 mark, if already marked continue
        if(vis[rem.vtx] == true) {
            // if already marked, skip this iteration
            continue;
        }
        // if not marked, mark it
        vis[rem.vtx] = true;
        // 2.3 work
        System.out.println("[" + rem.vtx + "] -> " + rem.psf + " @ " + rem.wsf);
        // 2.4 Add unvisited neighbour -> no need to mark
        for(Pair p : graph.get(rem.vtx)) {
            int nbr = p.nbr;

            if(vis[nbr] == false) {
                pq.add(new DPair(nbr, rem.wsf + p.wt, rem.psf + "-" + nbr));
            }
        }
    }
}
```

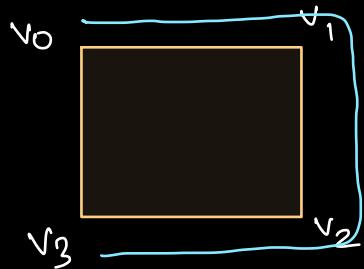

Custom Comparator

## Cycle in graphs

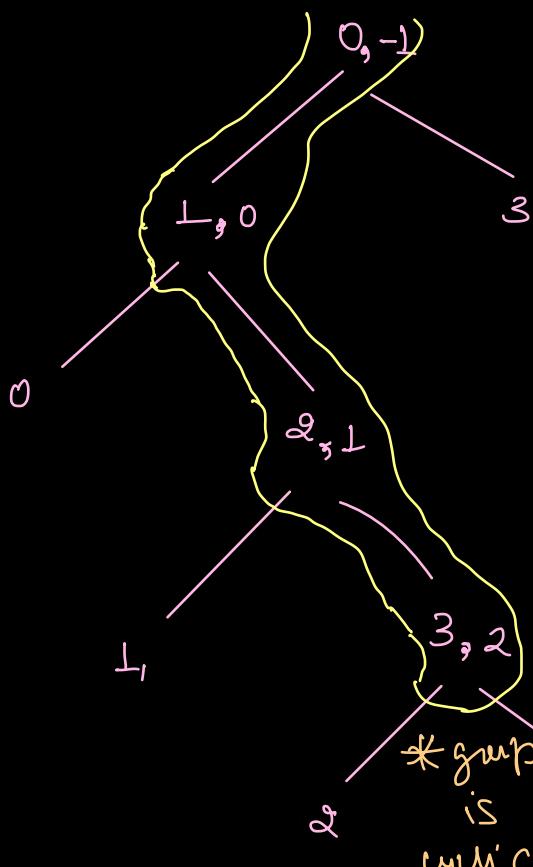

~~~~~

For undirected graph \rightarrow Using DFS

DFS

Vertx, parent

0 is already visited and also not parent of 3
→ different paths
→ cyclic graph

Code :

```
public class Solution {
    public boolean dfs(int u, int par, ArrayList<ArrayList<Integer>> adj, boolean[] vis) {
        vis[u] = true; // Marking the current vertex as visited.
        // Iterating over all the adjacent vertices.
        for (int v : adj.get(u)) {
            if (v == par) continue; // If the adjacent vertex is the parent, skip it.
            // If the current vertex is visited, we return true; else,
            // we call the function recursively to detect the cycle.
            if (vis[v] == true) return true;
            if (dfs(v, u, adj, vis) == true) return true;
        }
        return false; // No cycle found in the current path.
    }

    public boolean isCycle(int V, ArrayList<ArrayList<Integer>> adj) {
        boolean[] visited = new boolean[V]; // Tracking visited vertices.
        // Checking each vertex for a cycle.
        for (int i = 0; i < V; i++) {
            if (visited[i] == false) { // If vertex is not visited, we call dfs to detect cycle.
                boolean cycle = dfs(i, -1, adj, visited);
                if (cycle) return true; // If a cycle is detected, return true.
            }
        }
        return false; // No cycle found in the graph.
    }
}
```

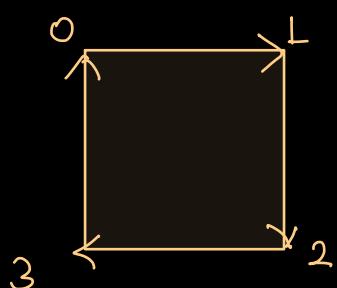

For directed graph \rightarrow Using Kahn's Algorithm [using Kahn's Algo]

Topological sort

While processing queue of topological sort problem.

Count of processed vertex $| = \text{total vertex}$

\hookrightarrow cycle is available in graph \Rightarrow Directed graph

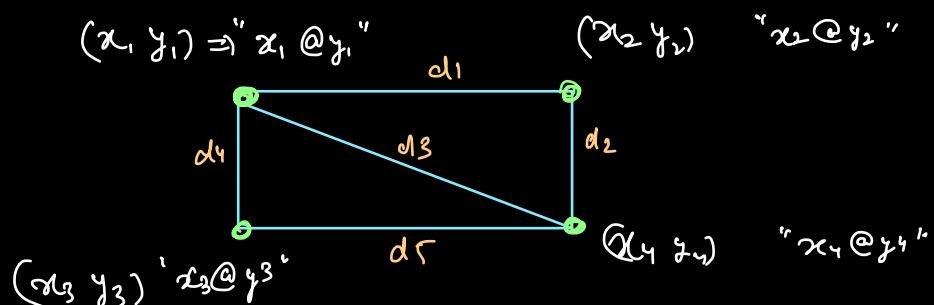

\rightarrow Because of Dependency, we can't even start execution.

\rightarrow Index never be 0 for all vertex

\Rightarrow Cycle is there

\rightarrow Directed graph is cyclic

```

// cycle detection in directed graph using indegree
public static void isCyclic(ArrayList<ArrayList<Integer>> graph) {
    int n = graph.size();
    // 1. prepare indegree array
    int[] indegree = new int[n];
    for(int v = 0; v < n; v++) {
        // and edge available from v->nbr
        // indegree of nbr increased by 1
        for(int nbr : graph.get(v)) {
            indegree[nbr]++;
        }
    }

    // 2. add 0 indegree vertex in queue and process it
    Queue<Integer> qu = new ArrayDeque<>();
    for(int v = 0; v < n; v++) {
        if(indegree[v] == 0) {
            qu.add(v);
        }
    }
}

```

```

// 3. Queue Processing
int count = 0;
while(qu.size() > 0) {
    // 3.1 Remove front element from queue
    int rem = qu.remove();
    // 3.2 increase count variable and remove vertex
    count++;
    // 3.3 Iterate on nbr of removed vertex and decrease
    // indegree of nbr, if indegree becomes 0, add it in que
    for(int nbr : graph.get(rem)) {
        indegree[nbr]--;
        if(indegree[nbr] == 0) {
            qu.add(nbr);
        }
    }
}

if(count != n) {
    System.out.println("Cyclic Graph");
} else {
    System.out.println("Acyclic Graph");
}
}

```
